Country: Software: Tags: This is a speech text recognition program developed for Linux. It works on various PDAs with a speech input method. Because of the portability aspects of PDAs, speech recognition is a highly developed field. However, speech recognition on PDAs has not been nearly as mature as speech recognition on desktops, so it requires programmers to use other techniques to achieve results. The main difference between Speech Recognition and Speech Synthesis (from the UE Voice SDK) is that with Speech Recognition the software has to be able to execute the acoustic models that will give meaning to the input speech. Generally these models are programmed in C++, and are stored in binary form in archives. In this way, when someone speaks, a dialogue between the PDA and the user can be initiated by the user. Introduction Speech Recognition is the capability to transform verbal utterances of a user into text. The application/computer (reader) which has this capability can then use it to either interpret or compose the speech. This is done by referencing an acoustic model which has been trained to classify similar utterances. An acoustic model is a collection of models that is representative of the patterns of sound/signal that can be generated by a specific source. For instance, a model may be trained on the speech generated by a particular speaker, but is not meant to be applied to other people. This tool utilizes TTSWizard (speech synthesis) by MEIKAI, a tool for the creation of speech (text to speech). It is a software application developed for Windows 95, 98, ME, NT4.1, 2000. It is a free open source project which you can get through igo-TTSWizard.zip. Features Speech transcription Text to speech (TTS) using a database of speech made from a specific person (continuous/festival) Using a database of voice for speech synthesis Anti-noise and Music noise suppression Supports the phone number format "dial + 7 8 9..." Support for all National Languages in Europe (German, English, French, Spanish, Italian, Português, Deutsch, Nederlands, Suomi, Suomi Anjuria, Suomen Kieli, Norsk, Portugiesh, Español, Polski, Czech, Polish, Magyar,
