Launch4j lets you convert Java applications into native Win32 executables. Make your programs look and behave just like you installed them. Launch4j makes deploying and running Java applications on all Windows platforms a breeze. It works with all major Java runtimes: the Java2 SDK/JRE and Java 6 and above. Here's what Launch4j does: * Launch4j uses its own binary launcher to start Java applications. This way, it overwrites the incorrect location of the JRE on the system, and it does not require a menu entry for launching and executing Java applications. * It converts JAR files into Windows executable files that can be copied on CD/DVD or run from removable media like flash drives. * It also offers a batch mode for converting and launching applications automatically in a directory. * It can launch desktop shortcuts for.url files. * If an error occurs, it displays a window that takes you directly to the download page of the JRE. * It installs the Java runtime JRE on the system if one is not currently present.
