The present invention relates to a process for forming a thin film on a substrate. 2. Description of the Related Art

Accompanying the trend toward downsizing and weight-reducing of electronic equipment, lighter and smaller devices are now in demand as the measures for realizing the same. For this purpose, a technique is now known for forming a thin film such as a silicon nitride layer, a silicon oxynitride layer, or an ITO (indium tin oxide) layer on a substrate (J. Appl. Phys. 74, 4301 (1993)). A thin film formed by sputtering, a thin film formed by electron beam evaporation, and a thin film formed by vacuum deposition, etc. have conventionally been used for the thin film forming. Thin film forming equipments used for them have been also so designed as to work on the basis of a production line by using a film forming target serving as a film forming material and a substrate. For example, Japanese Patent Application Laid-Open (KOKAI) No. H05-36201 (1993) and Japanese Patent Application Laid-Open (KOKAI) No. H11-181473 (1999) disclose that a silicon nitride (SiN) thin film is formed on a substrate using a film forming material including a silane (SiH.sub.4) gas and a nitrogen (N.sub.2) gas. Japanese Patent Application Laid-Open (KOKAI) No. H10-5627 (1998) discloses a technique for forming a multilayer SiN film on a substrate using a film forming material including an SiH.sub.4 gas, a N.sub.2 gas, and an H gas. Moreover, a technique is also known in which a thin film formed on a substrate by a film forming
