Controlling Layers Photoshop is a paint program — for image editing purposes only — in that it has two separate windows: one for image data and the other for the actual editing workspace. The two windows differ only in that the editing window has multiple layers and the image data window has one layer. The two windows work together to create the editing tools and controls. The image data window is where you keep image files and data. When you open a file in Photoshop, a single document with one layer is created. The layer window is the editing workspace and is where you paint your image. Layers are your canvas. Layers can be used to group pixels, where they exist, based on various attributes. The attributes can include colors, shapes, or other more abstract properties. Each type of layer provides its own controls and tools for creating graphics in the editing window. Here's how to use the layers feature: 1. In the Layers panel, select the New Layer icon or press Alt+Ctrl+N (Windows) or Shift+Ctrl+N (Mac OS) to create a new layer. 2. In the Layers panel, click a layer and then double-click the layer thumbnail to open the active layer in the main editing window, as shown in Figure 3-9. **Figure 3-9:** The New Layer icon (top) creates a new layer. 3. Double-click a thumbnail in the Layers panel to open an active layer in the main editing window (see Figure 3-10). 4. You can move and resize each of the layers in the Layers panel, as shown in Figure 3-11. **Figure 3-10:** Drag a layer from the Layers panel to create a new duplicate. **Figure 3-11:** The Layers panel lists all of the layers. The row of icons under the Layers panel also provides layer masks — tools that can be used to hide or reveal parts of a layer. Each layer has a default layer mask, or a black box over the entire layer, which you can

Effect of phenolic antioxidants on the mutagenicity of p-hydroxy-benzoic acid. 1. Antioxidants inhibited mutagenicity induced by p-hydroxybenzoic acid in the Ames test. 2. Methionine-initiated mutagenesis was suppressed to a greater extent than tryptophan-initiated mutagenesis by mixtures of two antioxidants. 3. The capacity for induction by p-hydroxybenzoic acid of mutations to histidine and proline was increased by antioxidants in the presence of F-9.10 Foods To Help You Lose Weight Fast The traditional way of balancing our diets with healthy food combinations is of course through boring, repetitive meals—we eat at least three meals per day. There are tons of different recipes and cooking methods, but the good thing about foods is that they can do a lot of magic tricks on our body. From weight loss to increased energy to a healthier metabolism, there are a lot of benefits to eating certain foods. What you eat everyday will not only impact your physical and mental well-being, but can also lead to excellent weight loss results. 10 Foods To Help You Lose Weight Fast 10 Foods To Help You Lose Weight Fast 1. Oatmeal Most of the time we know of oatmeal as the go-to breakfast option. But people tend to find it very simple to eat and can actually help with weight loss. Have you ever heard of the stereotype of the old lady who serves her grandkids oatmeal at breakfast? That's because the old lady knows how to make a really nutritious breakfast for her grandkids. There are many different ways to cook oatmeal. Some don't even have milk, with just water and crushed nuts or fruits. And although oats are very popular for weight loss these days, they are not the only ones. Nowadays there are even some exclusive 'weight loss' oat products that are quite popular. Oatmeal is known to contain magnesium, which is very good for regulating blood sugar level, high blood pressure, heart and kidney disorders, and in some cases it can help with osteoporosis. 2. Trout Have you ever had trout? I mean, you can still buy it in most grocery stores, but have you tried eating it raw? Trout is one of the foods that is very easy to eat and will definitely help you lose weight fast. Trout
