Samsat downloader hd 1080r.Engine WO-40B The Engine WO-40B was a World War II proposed advanced British mounted on the hull of the Royal Navy's anti-aircraft cruiser HMS Vernon. Both engines of the first prototypes were unreliable, and the project was abandoned in 1943. History Prior to the outbreak of the Second World War the Royal Navy was overwhelmingly dependent on diesel propulsion. Since 1905, Rolls-Royce had supplied a series of crude diesel engines powering various small vessels, and by the mid 1930s had entered heavy-horsepower designs like the RB.170 for the RN's Battleships. The RN's Fairey Swordfish biplane attack aircraft required a single engine; one Swordfish needed up to to get off the ground. The Royal Navy was also limited to the engine of the Vickers Vimy biplane in service. The Vernon needed a new engine and an increased radius of action. Admiral of the Fleet Sir James Arbuthnot first mooted the idea in February 1941 and the project was supported by both Winston Churchill and the First Sea Lord Admiral Sir Dudley Pound, but the project faced many obstacles. Description The WO-40B engine was driven through a mechanical gearbox and designed to provide a continuous output of. The gearbox was also needed to balance the forces generated by the twin sets of reciprocating pistons that operated the diameter crankshaft. The driver and a clutch were located at the front of the engine; the clutch of the first WO-40B project was noisy and unreliable. Even if the WO-40B engine had been successful, there was no intention to use it as a powerplant on any of the RN's surface ships. The Vernon was designed to transport the fighter aircraft of the Hawker Hurricane, which carried a maximum of for a top speed of.
