A digital rights management system is a combination of hardware and software that controls access to a computer readable medium and computer programs stored on it. Most modern computer readable media are always protected from copying, and computer programs are generally distributed by means of some type of secure transmission mechanism, such as an encrypted transmission link or a secure transmission method. There are many different types of digital rights management systems, but most include a number of basic elements, such as computer programs that implement a secure encryption method to protect the computer readable medium or computer programs that control access to the computer readable medium. The software and hardware elements of the digital rights management system work together to ensure that: (a) only people with the correct access rights can access the computer readable medium, (b) people with the correct access rights cannot copy or redistribute the computer readable medium, and (c) people with the correct access rights cannot view the computer readable medium. After the computer programs and the computer readable medium are distributed, a general purpose computer or a host computer may be connected to the computer readable medium to allow a person with the correct access rights to view the computer readable medium and the computer programs stored on it, or to redistribute the computer readable medium and the computer programs stored on it to other people. Once a person has acquired access rights to a computer readable medium, he is then able to use the medium and computer programs stored on the medium in any way he likes as long as he respects the access rights of others. Digital rights management systems are implemented with various encryption
