Some of Photoshop's tools are accessible from the menus, but most are available from a keyboard control panel. In Windows, press the Ctrl (control) key and the number keys 0 through 9, or use the appropriate menu to enter these instructions. In macOS, you can also use the directional keys on the keyboard to move around. Mastering Photoshop's basics Photoshop CS6 contains many improvements and new tools, and in this book, we walk you through Photoshop's user interface and menu structure. This tour includes the following major areas: Developing a document workspace: Loading and saving a document, using layers and the Layers panel Applying layers, filters, and other effects to your images Converting or retouching images in Photoshop Creating and placing text Drawing and painting Using the Blur and Sharpen tools Adjusting image brightness and contrast Getting to Know Photoshop Photoshop uses a workspace that's quite different from the one you're probably used to from other image editing programs. Instead of working in a window, you work in a canvas and place individual layers and commands on top of each other, much like working with a paintbrush on a canvas. Many of Photoshop's tools perform the same function on a layer as they do in a window; for example, the Lasso tool works the same way whether you have a window open or not. After you create layers and start adding commands to them, you can move the layers with the Move tool. Layers are like paints, and you can create as many of them as you like. The Blur and Sharpen tools modify image detail in the same way as changing the color of a brush on a canvas. Chapter 5 has more on this workspace. Getting to Know the Layers Panel Layers are the primary way you work with a Photoshop document. You add and remove them, and you move them around to change the order of the image. You can see all the layers in the Layers panel, and often it's the quickest way to work with an image; you place commands on the layers and then see the effect immediately. The Layers panel is a worksheet that's embedded into the Photoshop workspace; you can work with it all the time and it's the best way to see how individual commands affect the entire image. Here are some tips to keep in mind while working with the Layers panel: You can click

Q: $(1) \Rightarrow (2)$ in taylor's theorem In the theorem (1), we assume $a_k \in \mathbb{R}$, but could also assume that $a_k \in \mathbb{C}$, or something like that. From the first chapter of the book "An Introduction to Classical Harmonic Analysis", I know that if $a_k \in \mathbb{C}$ then: $$f(x) = \sum_{k=1}^{\infty} a_k \frac{x^k}{k!}$$ And also, if $f(x)$ is continuous at $x = 0$, then $a_k = 0$ for all $k \in \mathbb{N}$. But what if I don't know the type of a_k? A: If $a_k\in\Bbb{R}$ for each k then we get a real series. Then $\sum_{k=1}^{\infty} a_k\frac{x^k}{k!}$ is a continuous function for any x if and only if the series converges to that function, but this happens if and only if $\sum a_k$ converges, in which case, by the same criterion, f is continuous at $x=0$. You're correct that if a_k is complex for some k, then $\sum_{k=1}^{\infty} a_k\frac{x^k}{k!}$ is not continuous for any x even if the series converges, but you don't need to worry about that, since your statement implies only that $a_k=0$ for every k, so if there are more than finitely many non-zero a_k, then the series is continuous at $x=0$ anyway. Of course, either way, one has to know that $\sum_{k=1}^{\infty} a_k\frac{x^k}{k!}$ converges before one can do any of this. So this does all of the main parts of the problem, leaving only the fact that it can be true that the series converges for some values of x and not others

Q: .htaccess and php redirect I have a very simple.htaccess file that is redirecting a folder from its old location to the new location. RewriteEngine On RewriteCond %{REQUEST_URI}!^(.+)/$ RewriteRule ^(.*)$ [R=301,L] If I go to then the browser automatically redirects me to so if I want to stay on mysite.com/live do I just add an extra redirect? RewriteEngine On RewriteCond %{REQUEST_URI}!^(.+)/$ RewriteRule ^(.*)$ [R=301,L] Thanks! A: If your /live is a subdomain and you are using SSL, then you will need to keep this part in there as well: RewriteEngine On RewriteCond %{REQUEST_URI}!^(.+)/$ RewriteCond %{SERVER_PORT}!^443$ RewriteRule ^(.*)$ [R=301,L] This still redirects you http -> https on those requests. You will need to keep a listen on 80 or 443 because if someone is browsing the website, they will never see the change from HTTP to HTTPS. The present invention relates to a method of recording and playing back information such as images, speech, and the like, and more particularly, to an apparatus for recording and playing back compressed (encoded) information. Multimedia information such as speech, image, and the like has become popular as more and more information is being transmitted through various communication media. As such, there has been an increasing demand for recording and playing back multimedia information. To date, techniques for transmitting multimedia information through a broadcast have been developed for both motion video information and still image information, and therefore the most cost-effective method is to store the information at a transmission side. From the viewpoint of cost, there are a number of practical recording systems such as VTR (video tape recorder), DAT (digital audio tape recorder), STC (sectioned tape cassette), and the like.
