So what I want to ask is that. How can I convert my Windows partition to UNIX? I've searched a lot on the internet and there are some sort of solutions. But I have not find any one of them. Help me please. A: You can't convert a filesystem into another. Unix's POSIX compatibility is an implementation detail. You can however use it to convert your programs to run, and still keep your files. For example, you can use Cygwin, or another POSIX emulator on Windows, or you can use a Linux virtual machine (e.g., QEMU/KVM) on Windows, or run a program like GParted. If you want to convert your filesystem into the ISO-9660 filesystem that Linux/Mac OS use for disk images, there's a tool called mkisofs. It's included in most Linux distributions. (you can install the tool using your distribution's package manager). If you want to convert the filesystem of your Linux or Mac partitions to Windows FAT, you can use DiskInternals' mkfat A: Your question might be confusing to some, but a better title might be "How do I convert my Linux partition into a Windows" Linux partition. Some solutions to convert Linux into Windows include: Use VirtualBox (free) Use KVM Use QEMU (which has free and non-free versions) There is no special utility or program to convert between ext* and NTFS. Converting is all done at the file system level using commands like mkfs.ntfs or mkfs.ext4 Q: Detecting Neurons in Processing I've recently come across this lovely image found here: The application begins with an RGB image, and on mouse click, it converts the RGB values to a Grayscale, and on mouse click again, it converts the Grayscale values to a Neuronal Image (kinda). Is it possible to detect the 3 types of neurons (Fusiform, Orientated, and Rectangular) in this "Neuronal Image"? A: In your example, you have a good argument for slightly manual classification. I've used python-process library (available on PyPi) for some time now, and its curve.N cells can be used to detect orientation, size and value of region 1cdb36666d

O6-Alkylguanine DNA alkyltransferase (AGT, O6-alkylguanine DNA alkyltransferase, alkyltransferase [ET], E.C. 2.1.1.63) removes the DNA-damaging O6-alkyl group from O6-alkylguanine, a major intermediate in the metabolism of alkylating agents. We examined whether O6-alkylguanine DNA alkyltransferase activity and its expression in the same cells reflect in vivo activity. To address this issue, we measured AGT activity in isolated peripheral blood lymphocytes (PBL) of healthy donors and of patients with a variety of malignancies. Both AGT and E.C. 2.1.1.63 activity in PBL were higher in patients with lung or colon cancer than in healthy donors. Furthermore, AGT activity was greatly reduced in PBL of patients with acute nonly
