London Metropolitan University London Metropolitan University (LMU) is a university located in Hounslow, west London. Founded as Thames Polytechnic in 1988, it is affiliated to the University of London. History The first London Metropolitan University began as Thames Polytechnic, an institute of the polytechnic sector within Thames Valley University, and opened in October 1988. It is the oldest university of any type in the Thames Valley, having been established first as an Open University, and later being established as a college for Hounslow Council and providing degree courses and awarding its own degrees. In July 2005, London Metropolitan University merged with the colleges of West Thames College, Queen Mary's University of London and Westminster University. The Oxford and Cambridge and Greenwich clusters, based at Greenwich Peninsula, merged to form the new cluster called Thames Valley University. In 2013, London Metropolitan University had the largest student body of any university outside of the United States, with a student population of 46,000. In January 2018, the university was the subject of a BBC documentary The Truth About London Metropolitan University. The university had an initial application for FE recognition in November 2017, but this was cancelled in June 2019, when the government changed its policy to revoke the FE sector's automatic right of accreditation. In October 2019, London Metropolitan University's Board of Trustees, launched a consultation over proposed new membership that "would see the university grant degrees for certain academic subjects previously held by universities such as Roehampton and Kingston" as an integral part of the London Met brand, as well as enabling students to transfer their credits into fully recognised degrees. The consultation proposes London Met to become a foundation university, and add a third major: Health and Wellbeing Sciences. Organisation London Metropolitan University has campuses in Hounslow, and is based in Hounslow West,

Windows 10 Repair Solution If you have deleted your Windows 10 partition and want to get the software back, without paying a single penny, then follow the instructions in this tutorial. It is a very simple process, but it is something that you should do, if you want to keep your Windows 10 software without having to pay for it. 1. First of all, you need to remember that you are going to lose all your files and settings because you are going to do an impromptu installation. 2. First of all, if you are going to lose all your files and settings, the first thing you should do, is to download the latest version of the Windows 10 Recovery ISO. To do this, you will need to go to the following link: 3. Once you have downloaded the Windows 10 Recovery ISO, you can start a virtual Windows 10 machine using the Windows 10 ISO you have just downloaded. Using the Windows 10 ISO you just downloaded, is the best way to create a Windows 10 repair disc as long as you have an empty USB drive. 4. Once your ISO virtual machine is ready, you can open it on your virtual Windows 10 machine using a virtualization software (Microsoft Virtual PC, in my case). Once you have opened your virtual machine, you can add your USB drive to it. Right-click on your USB drive and choose Open. 5. Select the Windows 10 Repair ISO you have just created and once you have added it to your virtual Windows 10 machine, click on Open. Once you have done this, you can click on Startup Repair in order to restore your Windows 10. 6. Now, you are going to install all the missing Windows 10 updates in order to complete the process. 7. You can close the virtual Windows 10 machine when you have completed the installation process. 8. b7e8fdf5c8

Prior Art Circuit board connectors are widely used for connecting electronic circuits and parts to a printed circuit board. Such connectors have a housing into which a plurality of metal contacts are insertable, the contacts having flat terminal portions, which are insertable into plated through holes of the printed circuit board. The terminal portions normally carry relatively heavy current loads. Therefore the housing is made of a sturdy metal which is machined to precise dimensions. The housing of the connector is provided with a plurality of terminal positioning holes into which the terminal portions of the contacts are inserted. The terminal positioning holes, the contacts and the housing are mutually aligned to accurately and precisely position the contacts in the housing. It has been customary to mold the housing of the connector and its terminal positioning holes with synthetic resin. The synthetic resin mold is often made separately from the housing so that the synthetic resin mold serves as a base for the housing. The metal inserts are positioned in the base so as to simulate the terminal positioning holes in the housing. The insert is threaded to receive the terminal portions of the contacts and include the terminal positioning holes. A sealing material, such as a molten resin, is injected into the base and around the contacts. When the resin cures, it seals the base and the contacts
