Similar search results as Lagaan: Once Upon a Time in India (2001). Lagaan: Once Upon a Time in India (2001) Episodic. movie cast & crew. Aamir Khan, Gracy Singh, Paul T. Noble, Rachel Shelley. Indian movie released in 2001.

1. Technical Field The present invention relates to an image capturing apparatus including a lens barrel, a holder that holds a CCD sensor and that can move in the moving direction of the lens barrel, a connector that is attached to the holder, a motor unit that rotates the holder around a shaft, and a controller that controls the motor unit, and an image capturing system including the image capturing apparatus.
2. Related Art In an image capturing apparatus, such as a camera, an angular velocity sensor is mounted in a so-called movement detection region where a holder holding a CCD sensor can move. The angular velocity sensor generates a signal that changes in accordance with the angular velocity of the holder. The angle of the angular velocity

sensor (the angle of the driver axis of the angular velocity sensor) may be previously adjusted. JP-A-2007-312033 discloses an image capturing apparatus which includes a movement detection region where a holder holding a CCD sensor can move, an angular velocity sensor mounted in the movement detection region, and a controller that controls the motor unit by using a signal from the angular velocity sensor. In the image capturing apparatus of this publication, a balance weight is attached to a connector attached to the holder. By a moving operation of the holder holding the CCD sensor, the balance weight rotates around the shaft, and the angular velocity sensor causes the angular velocity sensor to generate a signal having a value that indicates the angular velocity of the balance weight. The controller controls the motor unit by using the signal from the angular velocity sensor. JP-A-2004-286331 discloses an image capturing apparatus which includes a holder holding a CCD sensor, a connector attached to the holder, and a balance weight that rotates around a shaft that is attached to the holder. In the image capturing apparatus of this publication, the center of gravity of the balance weight and the CCD sensor are made to coincide with the center of rotation of the holder, and the holder moves together with the balance weight. When the holder moves together with the balance weight, the distance between the rotation center of the holder and the balance weight changes in accordance with the movement of the holder. When the

downloads This invention relates to an electronic distribution system and associated method and, more particularly, to such an electronic distribution system and method in which they are used to synchronize a plurality of sensors within the network with one another and with the network. The current economic environment makes it more and more desirable for businesses to improve their operating efficiency and, in particular, to monitor and control the operation of critical systems within their facilities. One particular type of system that can be difficult to monitor and control is a water treatment system. Such a system must be monitored to ensure that a pump within the system is operating at a desirable speed and that the system is receiving a sufficient amount of water. In particular, the levels of the water in each of a plurality of reservoirs of the system must be checked periodically. In the past, a water treatment system has been monitored using a so-called "remote network". In a typical such a system, a pump in the system supplies a supply of water to each of a plurality of reservoirs of the system. These reservoirs are spaced apart from the pump and are typically not visible. Thus, in order to monitor the levels of the water in the reservoirs, sensors are used that are connected to the reservoirs. Each such sensor must periodically transmit a signal to a corresponding individual sensor.

One problem with this arrangement is that while the sensor is periodically transmitting a signal, it is not available to perform other tasks, such as receiving other signals. As a result, the sensors become unavailable for periods of time during which the reservoir levels must be monitored. In order to improve this situation, it has been proposed to synchronize the sensors within the network. One technique that is employed to synchronize the sensors within such a network is so-called "time-division multiplexing (TDM)". In such an arrangement, a loop of cable is used to link the sensors together. The loop of cable is divided into a plurality of time slots. The sensors in the loop are switched at the start of a time slot to provide a "scanning" function and are then assigned to remain in the time slot until the end of the time slot. This arrangement, while it is effective, imposes the requirement that the sensors must be switched when the time slots are provided. The switching has the effect of momentarily disconnecting the sensors from the network. This, in turn, has the effect of preventing the sensors from communicating with other sensors in the system.Q: "Но вправ
