The crop tool is one of the most powerful tools in Adobe Photoshop, but arguably the least intuitive. It's hard to understand to what extent it provides cropping out of a document. This review probably goes beyond that issue. I'm working through the results of a Photoshop review because I've been approached by a major retailer about including Lightroom (the front page of their site goes to Lightroom with manuals and previews on one page). I'd like to finish the main review of Photoshop before I do that. For example, we only use reviews that are written by someone licensed to write reviews as opposed to a company that purchased the product. We also use only longer reviews. Reviews that only look at aspects of the software, such as "This is a fast processor," don't rate as highly as reviews that use meaningful criteria, such as "This software worked well for me in 17 minutes." The screenshots and the trade-offs are presented in terms of the positive effect that Adobe Photoshop has on your ability to edit, share, and create. Reviews can be trusted even if the authors have bought the software. Some reviewers make input about the software intentionally misleading or incomplete. Also, reviewers take sides, sometimes authoritatively. For example, one reviewer called the product "'awful' in all but name" in the 2008 review of Photoshop CS2, but since installs more background operations than previous versions of Photoshop, it's not clear how AWFUL it can be. The GPU-accelerated Photoshop files support both Photoshop and Lightroom 4, and the Lightroom 4 GPU instructs Photoshop to use the equivalent of a full-duplex native-hardware GPU. The GPU and software company AMD first discussed Photoshop and Lightroom GPU acceleration in February 2012, and AMD said that the Radeon HD 6700, 6700D and 6700 series GPUs were already in use with Lightroom and Photoshop. Some third-party GPUs, such as the NVIDIA Quadro FX 1600 and ATI high-end FireGL cards, are more powerful than some of the AMD Radeon cards.
